High-Efficiency Separations at Any pH
The Hamilton PRP-C18 is a new HPLC column designed to provide high-efficiency, reversed-phase separations over an extended column life in nearly any mobile phase or pH. The rigid stationary phase has excellent mechanical and thermal stability, does not experience shrinking or swelling, and is completely inert to most conditions commonly encountered in reversed-phase chromatography.

The Hamilton PRP-C18 Column is a durable and effective column for general purpose HPLC and is especially well-suited for specialized applications in the clinical, pharmaceutical, environmental, food, forensics and life sciences industries.

Rugged Design
The PRP-C18 column has similar mechanical stability and separation efficiency to that of a traditional octadecysilane (ODS); however, the PRP-C18 stationary phase does not strip, bleed or dissolve under the most extreme conditions (e.g., pH 1–13, temperatures > 100°C). It will perform reliably and reproducibly throughout an extended column lifetime, regardless of mobile phase conditions. These characteristics allow for an expanded mobile phase repertoire for use in methods development or aggressive regeneration procedures.

Benefits of the PRP-C18 HPLC Column:
- Excellent mechanical and thermal stability (> 100°C)
- Can be regenerated in high acidic or basic concentrations (1 M)
- High-efficiency reversed-phase separations in nearly any mobile phase or pH
- Performs extreme applications not possible with traditional ODS C18 columns

Prolonged Exposure to Harsh Conditions

Separation of standard mix after 200 column volumes 1 M NaOH and 1 M H₂SO₄.
**No pH Limitations**

Mobile phase pH is a powerful tool in methods development for ionizable solutes. Separation of amines and other organic bases, which includes more than 70% of all drug compounds, has been a problem for a long time. The PRP-C18 column gives chromatographers the ability to employ an alkaline mobile phase (i.e., pH > 11) that allows for the separation of basic solutes in their neutral forms, expanding the window for elution and often greatly simplifying the process of methods development.

**Rapid Separations**

In throughput-driven industries such as drug discovery science, routine chromatography should not be a bottleneck. The PRP-C18 column increases productivity by offering a selection of shorter columns packed with smaller particles and operated at elevated flow rates. An HPLC run on a 50 mm, advanced polymer-based column generates well-defined, sharp peaks eluted with short runtimes.

**High pH Column Lifetime Comparison**

![Graph showing comparison of PRP-C18 and Traditional ODS column lifetimes](image)

**Fast Gradient Elution**

Separation of 12 standards in a short, 5 minute linear acetonitrile gradient.

**Experimental Conditions**

- **Column:** PRP-C18, 4.1 x 50 mm, 5 µm
- **Instrumentation:** Agilent 1100 quaternary pump with UV detector
- **Standards:** benzamide, nitromethane, methylparaben, ethylparaben, propylparaben, butylparaben, benzene, toluene, ethylbenzene, propylbenzene, pentyloctylbenzene, hexylbenzene
- **Mobile phase A:** Water + 0.2% Phosphoric Acid
- **Mobile phase B:** Acetonitrile + 0.2% Phosphoric Acid
- **Gradient:** 2 to 99% B in 5 minutes
- **Flow rate:** 2.5 mL/min
- **Temperature:** Ambient
- **Injection volume:** 2 µL
- **Detection:** UV at 255 nm
More Application Flexibility

The PRP-C18 provides chromatographers with a major advantage—the flexibility to tailor mobile phase pH according to the chemical nature of the sample. A mobile phase buffered to pH 12 permits separation of strong bases (i.e., pH > 9) in their neutral forms, which greatly simplifies methods development. Oftentimes a simple generic gradient is sufficient to achieve resolution between two solutes that would otherwise co-elute when separated at lower pH.

Increased Thermal Stability

Temperature is an important tool in methods development and routine analytical HPLC. Elevated temperature is commonly used to lower mobile phase viscosity, permitting elevated flow rates to shorten run times. An important property of the PRP-C18 column is that its efficiency increases with high operation temperatures. At 80°C, the plate count for the column more than doubles compared to the same separation performed at ambient temperatures. Unlike traditional ODS columns which experience measurable degradation when operated above the recommended temperature range (40°C), the Hamilton PRP-C18 column performs reliably up to and above 100°C. The PRP-C18 column’s ability to perform in high temperatures without prematurely shortening column life is especially useful in situations where improved resolution between two critical peaks is desired.

Easy Separation of Basic Drugs at High pH

![Fast separation of structurally diverse drug compounds at 80°C](image)

**Column:** Hamilton PRP-C18, 5 µm, 2.1 x 33 mm  
**Flow Rate:** 1.0 mL/min  
**Temperature:** 80°C  
**Injection Volume:** 5 µL  
**Flow Rate:** 1.0 mL/min  
**Mobile Phases:**  
A) 30 mM diethylamine (pH 11.5)  
B) Acetonitrile + 30 mM diethylamine  
**Gradient:** 2 to 99% B in 1 minute  
**Detection:** UV at 254 nm

**Analytes**  
1. Ephedrine  
2. Norephedrine  
3. Nicotine  
4. Metoprolol  
5. Quinine  
6. Doxylamine  
7. Diphenhydramine  
8. Nortriptyline  
9. Amitriptyline
